

VS code:

- VS code is used to develop projects
- Both frontend and backend is supported by VS code.
- we can create a whole web application in the VS codes.

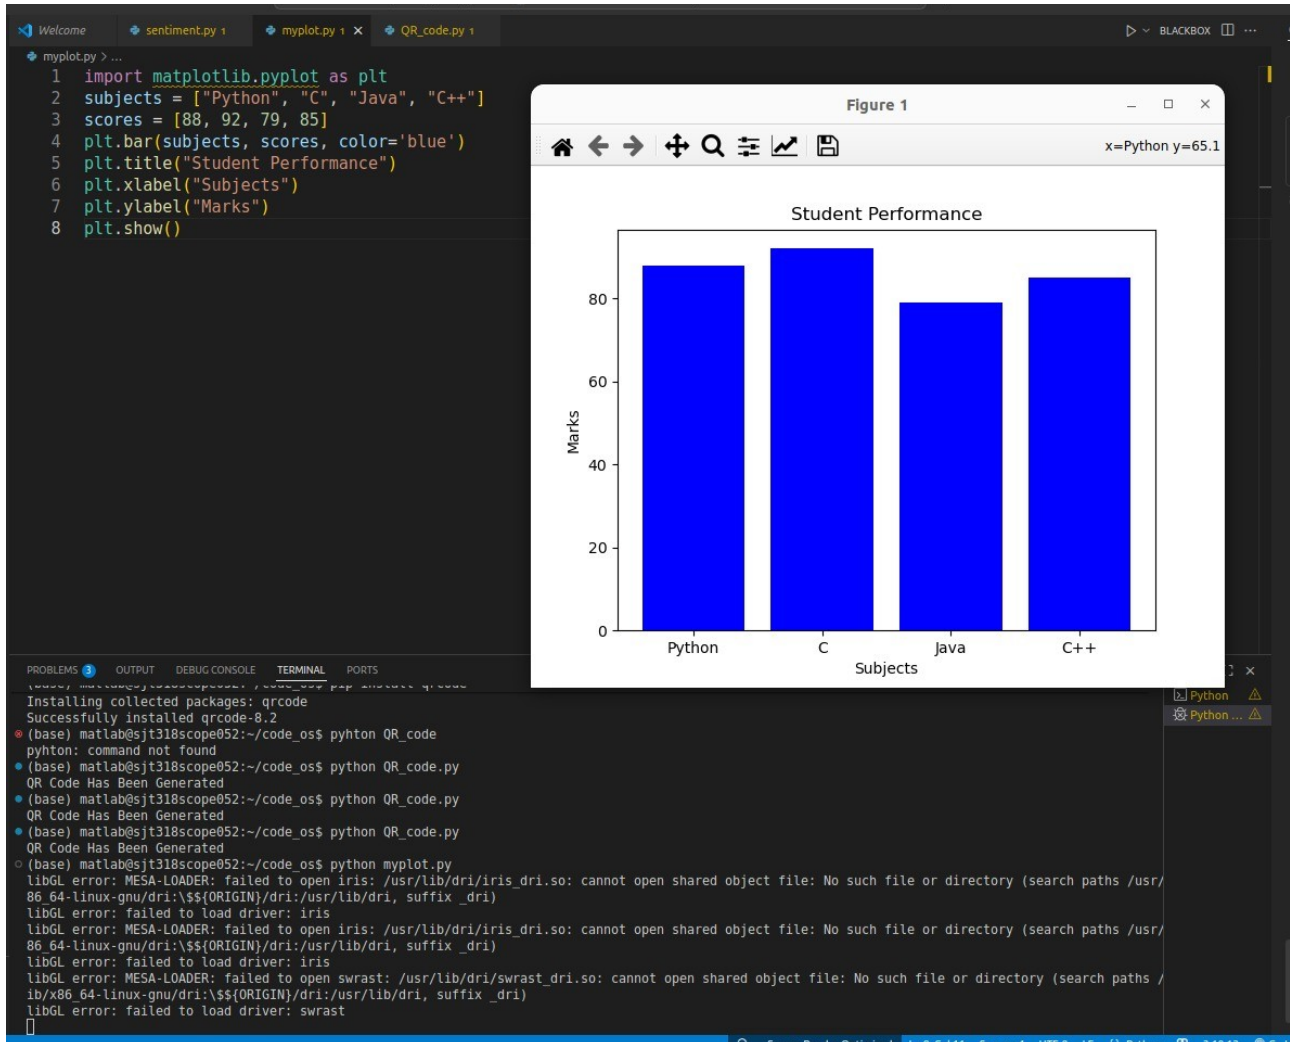

1) Sentimental Analysis:

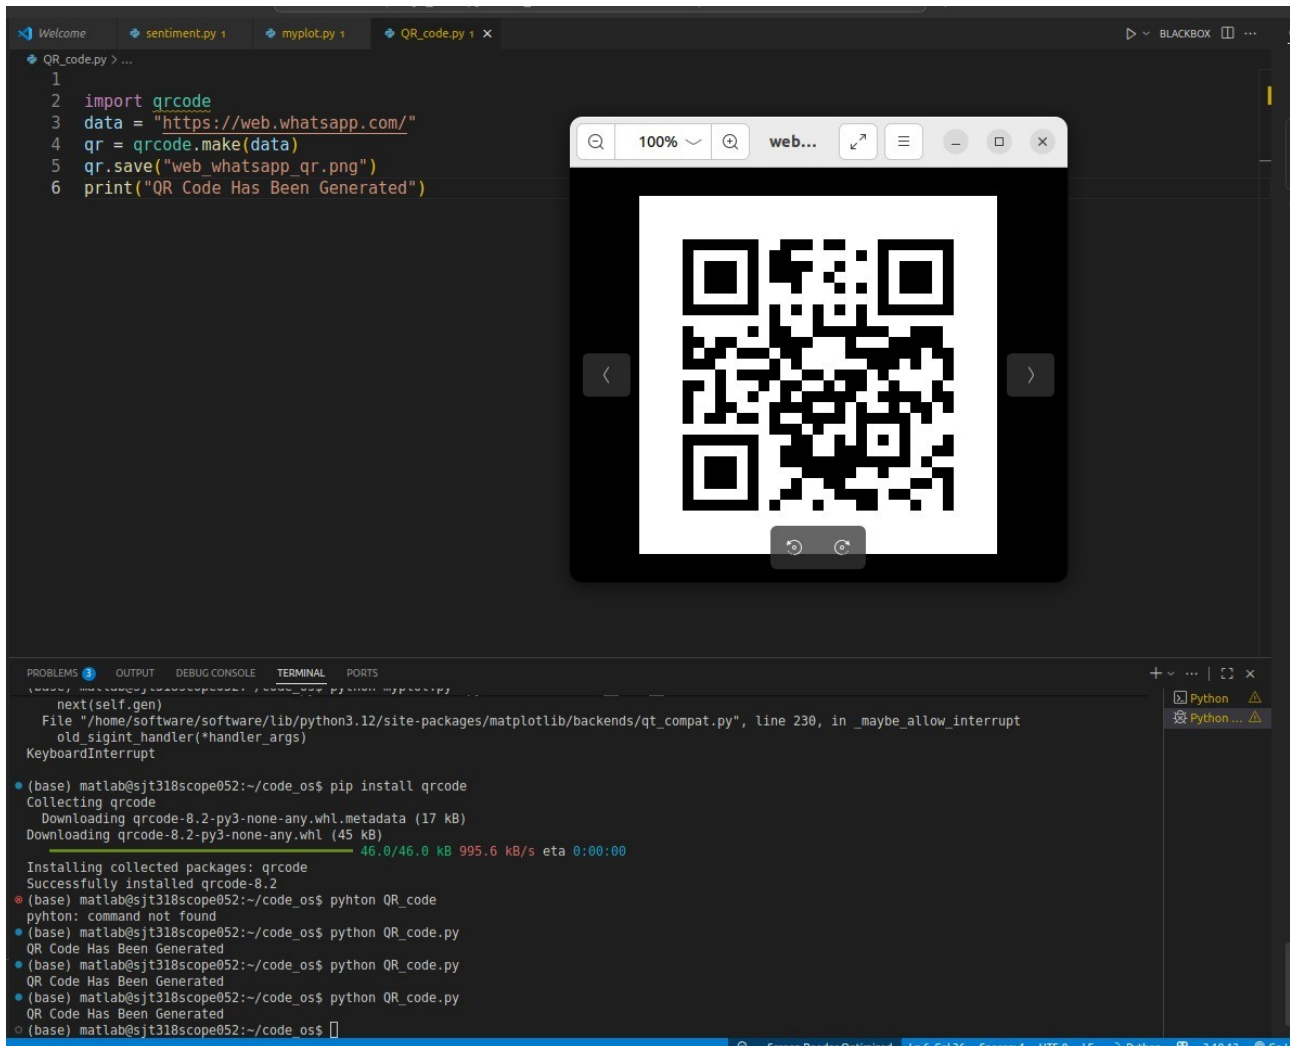

```
1 |
2 | from textblob import TextBlob
3 | text = input("Enter a sentence: ")
4 | blob = TextBlob(text)
5 | print("Polarity:", blob.sentiment.polarity)
6 | print("Subjectivity:", blob.sentiment.subjectivity)
7 | if blob.sentiment.polarity > 0:
8 |     print("Sentiment: Positive ")
9 | elif blob.sentiment.polarity < 0:
10 |    print("Sentiment: Negative")
11 | else:
12 |    print("Sentiment: Neutral ")

Enter a sentence: this python class is going good
Polarity: 0.7
Subjectivity: 0.6000000000000001
Sentiment: Positive
```

2) Matplotlib – plotting.

3) Generating QR

The screenshot displays a code editor with a Python script for generating a QR code. The script imports the `qrcode` module, sets the data to `https://web.whatsapp.com/`, creates a QR code, saves it as `web_whatsapp_qr.png`, and prints a confirmation message. A browser window in the background shows the generated QR code. The terminal window at the bottom shows the installation of the `qrcode` package and the execution of the script, which prints the message "QR Code Has Been Generated" three times.

```
1
2 import qrcode
3 data = "https://web.whatsapp.com/"
4 qr = qrcode.make(data)
5 qr.save("web_whatsapp_qr.png")
6 print("QR Code Has Been Generated")
```

```
next(self.gen)
